THE OTT-LITE STORY - Photobiologist and pioneer in light research, Dr. John Ott, the inventor of time-lapse photography, discovered through 40 years of scientific research the remarkable effects specific wavelengths of natural light have on all living things. Dr. Ott developed the first OTT-LITE while filming "The Secrets of Life" for Walt Disney. A unique blend of rare earth phosphors allow

illumination which, unlike the bluer light of "Daylight" lamps, looks and feels like natural daylight. Additionally, the OTT-LITE low colour temperature eliminates excessive glare which can fade stamps and cause eye-strain. Widely used by collectors and dealers alike across the USA. Now stamps can be accurately shaded by day or night.
